Swiss-port # P56528 Mouse

Gene Symbol CD38

Gene Full Name CD38 antigen

Background The protein encoded by this gene is a non-lineage-restricted, type II transmembrane glycoprotein that

synthesizes and hydrolyzes cyclic adenosine 5'-diphosphate-ribose, an intracellular calcium ion mobilizing messenger. The release of soluble protein and the ability of membrane-bound protein to become internalized indicate both extracellular and intracellular functions for the protein. This protein has an N-terminal cytoplasmic tail, a single membrane-spanning domain, and a C-terminal extracellular region with four N-glycosylation sites. Crystal structure analysis demonstrates that the functional molecule is a dimer, with the central portion containing the catalytic site. It is used as a prognostic marker for patients with chronic lymphocytic leukemia. Alternative splicing results in multiple transcript

variants. [provided by RefSeq, Sep 2015]

Function Synthesizes the second messagers cyclic ADP-ribose and nicotinate-adenine dinucleotide phosphate,

the former a second messenger for glucose-induced insulin secretion. Also has cADPr hydrolase activity.

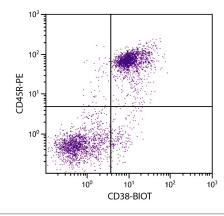

Also moonlights as a receptor in cells of the immune system. [UniProt]

Research Area Cancer antibody; Developmental Biology antibody; Immune System antibody; Metabolism antibody;

Pro-B Cell Marker antibody; Pre-B Cell Marker antibody
