Gene Symbol CD86

Gene Full Name CD86 antigen

Background This gene encodes a type I membrane protein that is a member of the immunoglobulin superfamily.

This protein is expressed by antigen-presenting cells, and it is the ligand for two proteins at the cell surface of T cells, CD28 antigen and cytotoxic T-lymphocyte-associated protein 4. Binding of this protein with CD28 antigen is a costimulatory signal for activation of the T-cell. Binding of this protein with cytotoxic T-lymphocyte-associated protein 4 negatively regulates T-cell activation and diminishes the immune response. Alternative splicing results in several transcript variants encoding different

isoforms.[provided by RefSeq, May 2011]

Function Receptor involved in the costimulatory signal essential for T-lymphocyte proliferation and interleukin-2

production, by binding CD28 or CTLA-4. May play a critical role in the early events of T-cell activation and costimulation of naive T-cells, such as deciding between immunity and anergy that is made by T-cells within 24 hours after activation. Isoform 2 interferes with the formation of CD86 clusters, and thus

acts as a negative regulator of T-cell activation. [UniProt]
