Bioinformation

Gene Symbol	RPS6KA6
Gene Full Name	ribosomal protein S6 kinase, 90kDa, polypeptide 6
Background	This gene encodes a member of ribosomal S6 kinase family, serine-threonine protein kinases which are regulated by growth factors. The encoded protein may be distinct from other members of this family, however, as studies suggest it is not growth factor dependent and may not participate in the same signaling pathways. [provided by RefSeq, Jan 2010]
Function	Constitutively active serine/threonine-protein kinase that exhibits growth-factor-independent kinase activity and that may participate in p53/TP53-dependent cell growth arrest signaling and play an inhibitory role during embryogenesis. [UniProt]
Calculated Mw	84 kDa
PTM	Phosphorylated at Ser-232, Ser-372, and Ser-389 in serum-starved cells. [UniProt]
Cellular Localization	Cytoplasm, cytosol. Nucleus. Note=Predominantly cytosolic. [UniProt]
