Bioinformation

Database links	GeneID: 1378 Human Swiss-port # P17927 Human
Gene Symbol	CR1
Gene Full Name	complement component (3b/4b) receptor 1 (Knops blood group)
Background	CD35 (complement receptor 1, CR1) is a monomeric multiple modular cell surface glycoprotein which serves as receptor for C3b and C4b, the most important components of the complement system leading to clearance of foreign macromolecules. It is expressed mainly on the surface of granulocytes, monocytes, erythrocytes, B cells and follicular dendritic cells. Besides its role in complement cascade, CD35 is involved in blocking BCR-induced proliferation and the differentiation of B cells to plasmablasts and their Ig production.
Function	Mediates cellular binding of particles and immune complexes that have activated complement. [UniProt]
Research Area	Developmental Biology antibody; Immune System antibody
Calculated Mw	224 kDa
