Bioinformation

Gene Symbol BMP10

Gene Full Name bone morphogenetic protein 10

Background The protein encoded by this gene is a member of the TGF-beta family of growth factors. Data suggest

that the similar protein in mouse plays an important role in trabeculation of the embryonic heart. In human, this protein may signal through receptor serine/threonine kinases. [provided by RefSeq, Jul

2008]

Function Required for maintaining the proliferative activity of embryonic cardiomyocytes by preventing

premature activation of the negative cell cycle regulator CDKN1C/p57KIP and maintaining the required expression levels of cardiogenic factors such as MEF2C and NKX2-5. Acts as a ligand for ACVRL1/ALK1, BMPR1A/ALK3 and BMPR1B/ALK6, leading to activation of SMAD1, SMAD5 and SMAD8 transcription factors. Inhibits endothelial cell migration and growth. May reduce cell migration and cell matrix
